AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions and listings of claims in the

application:

LISTING OF CLAIMS:

1. (PREVIOUSLY PRESENTED): A sound field correcting method in an audio system

which includes a plurality of variable gain type frequency discriminating means for

discriminating input audio signals into a plurality of frequencies, and delaying means for

adjusting delay times of the audio signals that are frequency-discriminated by the variable gain

type frequency discriminating means, whereby the audio signals are supplied to sound generating

means via the variable gain type frequency discriminating means and the delaying means, said

method comprising:

a first step of supplying a noise to the sound generating means via the variable gain type

frequency discriminating means and the delaying means, and then detecting reproduced sounds

generated by the sound generating means;

a second step of analyzing frequency characteristics of the reproduced sounds based on

detection results detected by said first step in answer to the variable gain type frequency

discriminating means;

a third step of supplying the noise to the sound generating means via the plurality of

variable gain type frequency discriminating means and the delaying means, and then detecting

the reproduced sounds generated by the sound generating means;

Application Number 09/781,274

Art Unit: 2644

Our Ref: Q62548

a fourth step of analyzing delay characteristics of the reproduced sounds based on the

detection results detected by said third step; and

a fifth step of adjusting frequency characteristics of the variable gain type frequency

discriminating means based on the frequency characteristics obtained by said second step, and

adjusting delay times of the delaying means based on the delay characteristics obtained by said

fourth step,

wherein the reproduced sounds generated by the sound generating means are detected

plural times by the same sound generating means and by repeating said first step plural times, the

frequency characteristics are analyzed in said second step based on multiplied values of plural

times detection results, and the frequency characteristics of the variable gain type frequency

discriminating means are adjusted in said fifth step based on the frequency characteristics

obtained from the multiplied values.

Claim 2. (CANCELED).

3. (ORIGINAL): A sound field correcting method in an audio system according to claim

1, wherein, in said first step, the reproduced sounds generated by the sound generating means are

detected under such a condition that the frequency characteristics of the variable gain type

frequency discriminating means are adjusted previously by using target curve data.

Application Number 09/781,274

Art Unit: 2644

Our Ref: Q62548

4. (ORIGINAL): A sound field correcting method in an audio system according to claim

1, wherein the reproduced sounds generated by said sound generating means are detected plural

times by repeating said third step plural times, the delay characteristics are analyzed in said

fourth step based on an average value of plural times detection results, and the delay times of the

delaying means are adjusted in said fifth step based on delay characteristics obtained from the

average value.

5. (PREVIOUSLY PRESENTED) A sound field correcting method in an audio system which

supplies a plurality of input audio signals to a plurality of sound generating means via a plurality

of signal transmission lines, each of the signal transmission lines including a plurality of variable

gain type frequency discriminating means for discriminating input audio signals into a plurality

of frequencies, channel-to-channel level adjusting means for adjusting levels of the audio signals,

and delaying means for adjusting delay times of the audio signals that are frequency-

discriminated by the variable gain type frequency discriminating means, whereby the audio

signals are supplied to sound generating means via the variable gain type frequency

discriminating means, the channel-to-channel level adjusting means, and the delaying means,

said method comprising:

a first step of supplying a noise to respective signal transmission lines via the variable

gain type frequency discriminating means, the channel-to-channel level adjusting means, and the

delaying means, then detecting reproduced sounds generated by the sound generating means via

respective signal transmission lines, and then analyzing frequency characteristics of the

Our Ref: Q62548 Art Unit: 2644

reproduced sounds via respective signal transmission lines based on detection results in answer

to the variable gain type frequency discriminating means;

a second step of adjusting frequency characteristics of the variable gain type frequency

discriminating means on respective signal transmission lines based on the frequency

characteristics obtained by said first step;

a third step of supplying the noise to respective signal transmission lines via the variable

gain type frequency discriminating means, the channel-to-channel level adjusting means, and the

delaying means, then detecting the reproduced sounds generated by the sound generating means

via respective signal transmission lines, and then analyzing delay characteristics of the

reproduced sounds via respective signal transmission lines based on detection results;

a fourth step of adjusting delay times of the delaying means on respective signal

transmission lines based on the delay characteristics obtained by said third step;

a fifth step of supplying the noise to respective signal transmission lines via the variable

gain type frequency discriminating means, the channel-to-channel level adjusting means, and the

delaying means, then detecting the reproduced sounds generated by the sound generating means

via respective signal transmission lines, and then analyzing levels of the reproduced sounds via

respective signal transmission lines based on detection results; and

a sixth step of adjusting the channel-to-channel level adjusting means based on analyzed

results of the levels of the reproduced sounds obtained by said fifth step via respective signal

transmission lines,

Application Number 09/781,274

Our Ref: Q62548

Art Unit: 2644

wherein the reproduced sounds generated by the sound generating means during said

first step are detected plural times by the same sound generating means and by repeating said

first step a plurality of times.

6. (ORIGINAL): A sound field correcting method in an audio system according to claim

5, wherein, in said first step, the reproduced sounds generated by the sound generating means are

detected under such a condition that the frequency characteristics of the variable gain type

frequency discriminating means are adjusted previously by using target curve data.

7. (ORIGINAL): A sound field correcting method in an audio system according to claim

5, wherein said first step and said second step are repeated plural times, and said first step is

performed under such a condition that the frequency characteristics of the variable gain type

frequency discriminating means are adjusted in said second step.

8. (ORIGINAL): A sound field correcting method in an audio system according to claim 5,

wherein, in said sixth step, an adjusted amount of the plurality of channel-to-channel level

adjusting means are corrected such that a spectrum average level of the reproduced sounds

reproduced by the plurality of sound generating means are made flat over all audio frequency

bands.

9. (ORIGINAL): A sound field correcting method in an audio system according to claim

5, wherein the audio system is a multi-channel audio system that supplies the audio signals to all

frequency band sound generating means having a reproducing frequency characteristic that is

substantially equal to the audio frequency band and a low frequency band exclusively

reproducing sound generating means having a reproducing frequency characteristic that is

substantially equal to the low frequency band of the audio frequency band.

10. (PREVIOUSLY PRESENTED) A sound field correcting method in an audio system, said

method comprising:

supplying a noise to speakers via variable gain type frequency discriminator circuits and

delay circuits to generate first reproduced sounds;

detecting the first reproduced sounds generated by the speakers;

analyzing frequency characteristics of the first reproduced sounds;

supplying the noise to the speakers via the variable gain type frequency discriminator

circuits and the delay circuits to generate second reproduced sounds;

detecting the second reproduced sounds generated by the speakers;

analyzing delay characteristics of the second reproduced sounds; and

adjusting frequency characteristics of the variable gain type frequency discriminator

circuits based on the frequency characteristics obtained by said analyzing frequency

characteristics of the first reproduced sounds; and

Application Number 09/781,274

Our Ref: Q62548 Art Unit: 2644

adjusting delay times of the delay circuits based on the delay characteristics obtained by

said analyzing delay characteristics of the second reproduced sounds,

wherein the noise is supplied to the same speakers a plurality of times and the first

reproduced sounds generated by the speakers are detected a plurality of times,

wherein the frequency characteristics are analyzed based on multiplied value created

from results of analyzing frequency characteristics a plurality of times, and

when the frequency characteristics of the variable gain type frequency discriminator

circuits are adjusted based on the frequency characteristics obtained from the multiplied values.

11. (PREVIOUSLY PRESENTED) A sound field correcting method in an audio system

according to claim 10, wherein, the first reproduced sounds generated by the sound generators

are detected under such a condition that the frequency characteristics of the variable gain type

frequency discriminator circuit are adjusted previously by using target curve data.

12. (PREVIOUSLY PRESENTED) A sound field correcting method in an audio system

according to claim 10, wherein the second reproduced sounds generated by said sound generators

are detected a plurality of times, the delay characteristics are analyzed based on an average value

of results of said detection said plurality of times, and the delay times of the delay circuits are

adjusted based on delay characteristics obtained from the average value.

13. (PREVIOUSLY PRESENTED) A sound field correcting method comprising:

supplying a noise to respective signal transmission lines via variable gain type

frequency discriminator circuits, channel-to-channel level adjusting circuits, and delay circuits,

then detecting reproduced sounds generated by sound generators via respective signal

transmission lines, and then analyzing frequency characteristics of the reproduced sounds via

respective signal transmission lines based on detection results;

adjusting frequency characteristics of the variable gain type frequency discriminator

circuits on respective signal transmission lines based on the analyzed frequency characteristics;

supplying the noise to respective signal transmission lines via the variable gain type

frequency discriminator circuits, the channel-to-channel level adjusting circuits, and the delay

circuits, then detecting the reproduced sounds generated by the sound generators via respective

signal transmission lines, and then analyzing delay characteristics of the reproduced sounds via

respective signal transmission lines based on detection results;

adjusting delay times of the delay circuits on respective signal transmission lines based

on the analyzed delay characteristics;

supplying the noise to respective signal transmission lines via the variable gain type

frequency discriminator circuits, the channel-to-channel level adjusting circuits, and the delay

circuits, then detecting the reproduced sounds generated by the sound generators via respective

signal transmission lines, and then analyzing levels of the reproduced sounds via respective

signal transmission lines based on detection results; and

Application Number 09/781,274

Our Ref: Q62548

Art Unit: 2644

adjusting the channel-to-channel level adjusting circuits based on the analyzed results of

the levels of the reproduced sounds via the respective signal transmission lines.

14. (PREVIOUSLY PRESENTED) A sound field correcting method in an audio system

according to claim 13, wherein, the reproduced sounds generated by the sound generators are

detected under such a condition that the frequency characteristics of the variable gain type

frequency discriminator circuits are adjusted previously by using target curve data.

15. (PREVIOUSLY PRESENTED): A sound field correcting method in an audio system

according to claim 13, wherein:

supplying a noise to respective signal transmission lines via variable gain type

frequency discriminator circuits, channel-to-channel level adjusting circuits, and delay circuits,

then detecting reproduced sounds generated by the sound generators via respective signal

transmission lines, and then analyzing frequency characteristics of the reproduced sounds via

respective signal transmission lines based on detection results, and

said adjusting frequency characteristics of the variable gain type frequency

discriminator circuits on respective signal transmission lines based on the analyzed frequency

characteristics

are repeated a plurality of times.

Application Number 09/781,274

16. (PREVIOUSLY PRESENTED): A sound field correcting method in an audio system

Our Ref: Q62548 Art Unit: 2644

according to claim 13, wherein, in said adjusting the channel-to-channel level adjusting circuits

based on the analyzed results of the levels of the reproduced sounds via the respective signal

transmission lines, an adjusted amount of the plurality of channel-to-channel level adjusting

circuits are corrected such that a spectrum average level of the reproduced sounds reproduced by

the plurality of sound generators are made flat over all audio frequency bands.

17. (PREVIOUSLY PRESENTED): A sound field correcting method in an audio system

according to claim 13, wherein the audio system is a multi-channel audio system that supplies

the audio signals to all frequency band sound generators having a reproducing frequency

characteristic that is substantially equal to the audio frequency band and to a low frequency band

exclusively reproducing sound generators having a reproducing frequency characteristic that is

substantially equal to the low frequency band of the audio frequency band.

18. (PREVIOUSLY PRESENTED) A sound field correcting method in an audio system

according to claim 1, wherein a size of speakers of said audio system is determined and said

method is altered based on said determined speaker size.

19. (PREVIOUSLY PRESENTED) A sound field correcting method in an audio system

according to claim 5, wherein a size of speakers of said audio system is determined and said

method is altered based on said determined speaker size.

Application Number 09/781,274

Our Ref: Q62548 Art Unit: 2644

20. (NEW) A sound field collecting apparatus comprising:

a speaker that generates reproduced sound;

a sound collecting member that collects sound data with respect to a plurality of channels;

a first member that compares a collected sound data with a predetermined threshold value

with respect to each of said channels;

a second member that determines a size of the speaker according to a comparison result

of the first member; and

a third member that adjusts a frequency characteristic of the reproduced sound according

to the determined size of the speaker by the second member.

21. (NEW) The sound field collecting apparatus according to claim 20, wherein the

collected sound data is collected in a plurality of frequency bands, and

the collected sound data is an average of the collected sound data with respect to each of

said channels.

22. (NEW) The sound field collecting apparatus according to claim 21, wherein the

second member determines the speaker has a large size when the second member obtains a result

that the average is larger than the predetermined threshold value.

PRELIMINARY AMENDMENT AFTER RCE Application Number 09/781,274

Our Ref: Q62548 Art Unit: 2644

23. (NEW) The sound field collecting apparatus according to claim 21, wherein the second member determines the speaker has a small size when the second member obtains a result that the average is smaller than the predetermined threshold value.

24. (NEW) The sound field collecting apparatus according to claim 23, wherein a frequency characteristic with respect to the small-size speaker is not adjusted when the second member determines that the speaker has the small size.

25. (NEW) The sound field collecting apparatus according to claim 22, wherein a frequency characteristic with respect to the large-size speaker is adjusted when the second member determines that the speaker has the large size.
